Background: Clinical Data Packages

Objective

- Investigate how pharmaceutical companies construct clinical data packages
- Does foreign data "substitute" or "complement" for Japanese data?

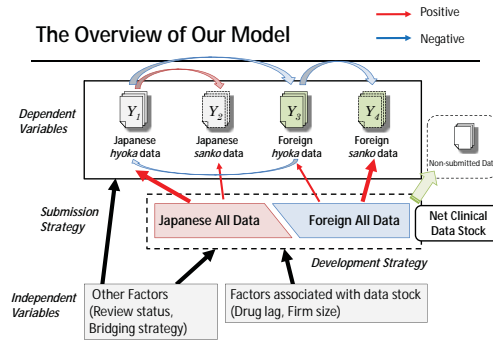

Methods

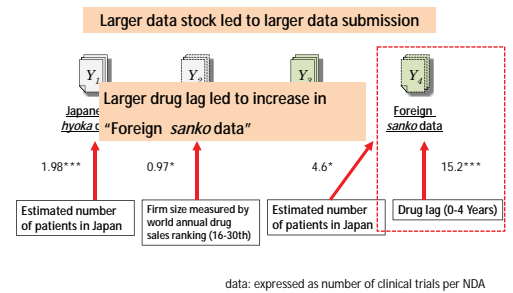

- Samples
 - 209 new drugs approved from 2001 to 2010 in Japan
- Regression analysis (Simultaneous equations model)
 - Dependent variables: Number of submitted JP hyoka/JP sanko/F hyoka/F sanko data per NDA
 - Estimated by three-stage least squares (3SLS)

$$\begin{aligned} \text{Japanese hyoka data } Y_{1i} &= \alpha_1 + \gamma_1 Y_{2i} + \beta_{11} X_{11i} + \dots + \varepsilon_{1i} \\ \text{Japanese sanko data } Y_{2i} &= \alpha_2 + \gamma_2 Y_{1i} + \beta_{21} X_{21i} + \dots + \varepsilon_{2i} \\ \text{Foreign hyoka data } Y_{3i} &= \alpha_3 + \gamma_3 Y_{4i} + \beta_{31} X_{31i} + \dots + \varepsilon_{3i} \\ \text{Foreign sanko data } Y_{4i} &= \alpha_4 + \gamma_4 Y_{3i} + \beta_{41} X_{41i} + \dots + \varepsilon_{4i} \end{aligned}$$

The Overview of Our Model

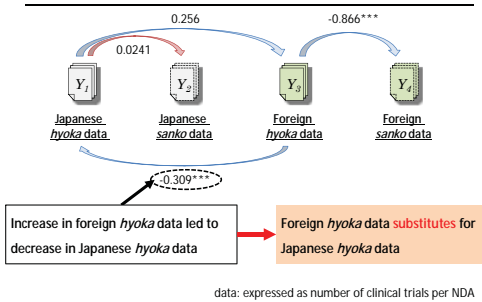

Results & Discussion Factors associated with data stock

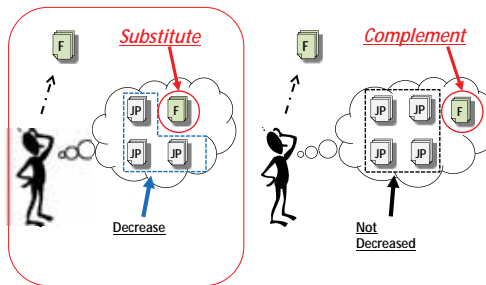

Results & Discussion Relationship between dependent variables

*p<0.1, **p<0.05, ***p<0.01

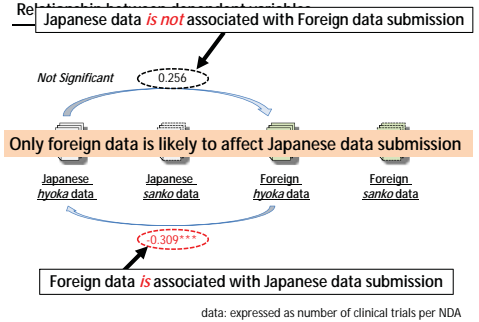

Results & Discussion Substitute or Complement?

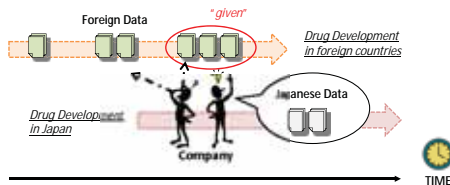

Results & Discussion

*p<0.1, **p<0.05, ***p<0.01

Results & Discussion

→ This result reconfirmed the common belief that companies decide Japanese data volume per NDA based on the "given" foreign data

Question Raised by Our Research

- Most Japanese clinical data packages depend on the "given" foreign data

What should the "ideal clinical data package" for Japanese people be like?
